Attention: Bill Sloan

Re. Featherston wastewater project - Donalds Creek flow monitoring

Dear Bill

A temporary flow monitoring site has been established on Donalds Creek at a point just upstream of the wastewater discharge location. The site was established on 22/2/2016.

Since the site installation 5 flow gaugings have been completed to rate or calibrate the site. Flow gauging calculation sheets are attached to this letter.

Please find attached:

Figure 1 - a stage hydrograph for the data collected to date

Figure 2 - a flow hydrograph for the data collected to date over the full stage range

Figure 3 - a flow hydrograph for the data collected to date for flows less than 500 litres/second

Figure 4 - the site rating curve as at June 2016

At this stage we have not been able to complete flow gaugings at high stage i.e. at flows greater than about 500 l/s. Therefore please treat higher flow data with caution at this stage as this may be subject to change as we refine the top end of the rating curve. The lower flow data i.e. less than about 500 l/s, should be fairly accurate.

Please note that prior to the middle of May all the flow at the recorder site was coming from the Torohanga Stream tributary, as Donalds Creek upstream of this point was dry.

If you have any queries regarding the enclosed information please don't hesitate to contact me.

Yours faithfully

G M Butcher
